## **NAME**

CURLOPT\_NOPROXY - disable proxy use for specific hosts

## **SYNOPSIS**

#include <curl/curl.h>

CURLcode curl\_easy\_setopt(CURL \*handle, CURLOPT\_NOPROXY, char \*noproxy);

# **DESCRIPTION**

Pass a pointer to a zero terminated string. The string consists of a comma separated list of host names that do not require a proxy to get reached, even if one is specified. The only wildcard available is a single \* character, which matches all hosts, and effectively disables the proxy. Each name in this list is matched as either a domain which contains the hostname, or the hostname itself. For example, example.com would match example.com, example.com; 80, and www.example.com, but not www.notanexample.com or example.com.othertld.

## **DEFAULT**

**NULL** 

# **PROTOCOLS**

Most

## **EXAMPLE**

**TODO** 

## **AVAILABILITY**

Added in 7.19.4

# **RETURN VALUE**

Returns CURLE\_OK if the option is supported, CURLE\_UNKNOWN\_OPTION if not, or CURLE\_OUT\_OF\_MEMORY if there was insufficient heap space.
